### Education

PhD, Economics, Arizona State University, 2017

Master, Economics, Simon Fraser University, 2013

MBA, Sharif University, 2012

Industrial Engineering, IUST, 2009

### Biography

Pedram Jahangiry, PhD, CFA, is an assistant professor in the Economics and Finance Department of the Jon M. Huntsman School of Business at Utah State University. Prior to joining the Huntsman School in 2018, Pedram was a research associate within Financial Modeling Group at BlackRock NYC. His research is involved in machine learning applications in finance, empirical asset pricing, and factor models.

# Where we are?

# Big picture: Econometrics vs Machine Learning

What are we trying to do as a researcher?

Solve real world problems, right?

Is there a theory?

What is the **relationship** between

- Sales and advertisement / R&D expenditure / seasonality / industry / ... ?
- Quantity demanded and price / income / technology / price of competitors / ... ?
- Wage and education/ age/ gender/ experience/ ...?

# ➔ A simple example

- Let's see if we can predict your future salary! (is there a theory?)
- What are the drivers:
  - Education, age, experience, IQ, ...
  - Ethnicity, race, gender, ...
  - Industry, location, working hours, ...
- Let's build a model (**assuming** a linear functional form!)

$$wage = \beta_0 + \beta_1 educ + \beta_2 age + \beta_3 exper + \beta_4 IQ + \dots + \beta_k hours + u$$

- Can you **interpret** this model? Do you care about the interpretability?
- Can you make **predictions** using your model?
- Can you make this functional form more flexible? What are the caveats?

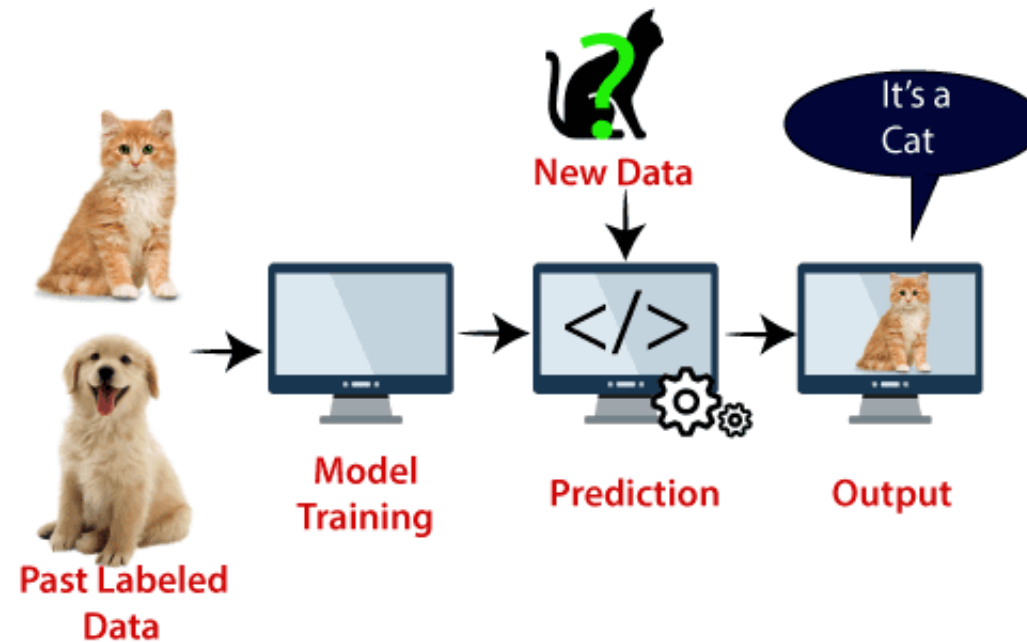

# A different example

- Cat vs dog classification problem (image recognition)

- Do you really care about **interpretability** of the model here?
- What about accuracy of your **predictions**?

# Statistical learning vs machine learning

	Statistical Learning	Machine Learning
Focus	Hypothesis testing & interpretability	Predictive accuracy
Driver	Math, theory, hypothesis	Fitting data
<b>Data size</b>	Any reasonable set	Big data
<b>Data type</b>	Structured	Structured, unstructured, semi-structured
Dimensions / scalability	Mostly <b>low</b> dimensional data	<b>High</b> dimensional data
Model choice	Parameter significance & in-sample goodness of fit	Cross-validation of predictive accuracy on partitions of data
<b>Interpretability</b>	<b>High</b>	<b>Low</b>
Strength	Understand <b>causal</b> relationship & behavior	Prediction (forecasting and nowcasting)

# ➔ A more complex example

## Apple stock price prediction

- What are the drivers:
  - Company's fundamentals (balance sheet, income statement, cash flow statement)
  - Competitors (comparing multiples)
  - Technical analysis!
  - Seasonality (holidays, months, days, ...)
- What else?
  - Market sentiment (news, tweets, blogger opinions, conference calls, ...)
  - Satellite images from Apple store parking lots!

# ➔ Why should I learn it?

- It's a bid deal
- ML is closely linked to data science
- Better Career Opportunities
- Better salaries
- Hedge against next recession
